Analysis of Health Survey for England (HSE) 2019

Candidate Numbers Here

March 01, 2024

Abstract

This report provides an analysis of data related to health, age, socio-economic factors and lifestyle habits in adults (from the age of 16) from the population in England, derived from the Health Survey for England 2019.

Introduction

This is a body of text. This is an italic body of text. This is a clickable link!.

Some YAML Stuff

The lion's share of a R Markdown document will be raw text, though the front matter may be the most important part of the document. R Markdown uses YAML for its metadata and the fields differ from what an author would use for a Beamer presentation. I provide a sample YAML metadata largely taken from this exact document and explain it below.

```
output:
   pdf_document:
     keep_tex: true
     fig_caption: true
     latex_engine: pdflatex

title: "A Pandoc Markdown Article Starter and Template"

abstract: "This document provides an introduction to R Markdown, argues for its..."

date: "`r format(Sys.time(), '%B %d, %Y')`"

geometry: margin=1in

fontsize: 11pt

# spacing: double
---
```

output: will tell R Markdown we want a PDF document rendered with LaTeX. Since we are adding a fair bit of custom options to this call, we specify pdf_document: on the next line (with, importantly, a two-space indent). We specify additional output-level options underneath it, each are indented with four spaces. The line (keep_tex: true) tells R Markdown to render a raw .tex file along with the PDF document. This is useful for both debugging and the publication stage. The next line fig_caption: true tells R Markdown to make sure that whatever images are included in the document are treated as figures in which our caption in brackets in a Markdown call is treated as the caption in the figure. The next line (latex_engine: pdflatex) tells R Markdown to use pdflatex and not some other option like lualatex. For this template, I'm pretty sure this is mandatory.[^pdflatex]

The next fields get to the heart of the document itself. title: is, intuitively, the title of the manuscript. Do note that fields like title: do not have to be in quotation marks, but must be in quotation marks if the title of the document includes a colon. That said, the only reason to use a colon in an article title is if it is followed by a subtitle, hence the optional field (subtitle:). Notice I "comment out" the subtitle in the above example with a pound sign since this particular document does not have a subtitle.

date comes standard with R Markdown and you can use it to enter the date of the most recent compile.

The next items are optional and cosmetic. geometry: is a standard option in LaTeX. I set the margins at one inch, and you probably should too. fontsize: sets, intuitively, the font size. The default is 10-point, but I prefer 11-point. spacing: is an optional field. If it is set as "double", the ensuing document is double-spaced. "single" is the only other valid entry for this field, though

not including the entry in the YAML metadata amounts to singlespacing the document by default. Notice I have this "commented out" in the example code.

Getting Started with Markdown Syntax

There are a lot of cheatsheets and reference guides for Markdown (e.g. Adam Prichard, Assemble, Rstudio, Rstudio again, Scott Boms, Daring Fireball, among, I'm sure, several others).

```
# Introduction
**Lorem ipsum** dolor *sit amet*.
- Single asterisks italicize text *like this*.
- Double asterisks embolden text **like this**.
Start a new paragraph with a blank line separating paragraphs.
- This will start an unordered list environment, and this will be the first item.
- This will be a second item.
- A third item.
   - Four spaces and a dash create a sublist and this item in it.
- The fourth item.
1. This starts a numerical list.
2. This is no. 2 in the numerical list.
# This Starts A New Section
## This is a Subsection
### This is a Subsubsection
#### This starts a Paragraph Block.
> This will create a block quote, if you want one.
Want a table? This will create one.
Table Header | Second Header
----- | ------
             | Cell 2
Table Cell
Cell 3
              | Cell 4
Note that the separators *do not* have to be aligned.
Want an image? This will do it.
![caption for my image](path/to/image.jpg)
`fig_caption: yes` will provide a caption. Put that in the YAML metadata.
```

```
Almost forgot about creating a footnote. [^1] This will do it again. [^2]

[^1]: The first footnote

[^2]: The second footnote

Want to cite something?

- Find your biblatexkey in your bib file.
- Put an @ before it, like @smith1984, or whatever it is.
- @smith1984 creates an in-text citation (e.g. Smith (1984) says...)
- [@smith1984] creates a parenthetical citation (Smith, 1984)

That'll also automatically create a reference list at the end of the document.

[In-text link to Google](http://google.com) as well.
```
